FOREWORD

The National Air Pollution Surveillance Program (NAPS) is a joint project of the federal and provincial levels of government.

A knowledge of the nature and extent of air pollution across Canada is fundamental to the sound planning of control and abatement programs. In its broadest context, therefore, the purpose of the National Air Pollution Surveillance Program is to monitor and assess, on a continuing basis, the quality of the ambient air in the urban regions of Canada. The program also serves a number of other needs, and in this respect becomes increasingly useful as data accumulate. For example, with the passage of time it will be possible to detect trends in pollution levels with respect to changing industrial activity, population density and progress in air pollution abatement measures.

It was for these reasons that during their annual meetings of 1969 and 1970, federal and provincial air pollution control officials agreed that priority should be given to the establishment of a comprehensive national air pollution surveillance program. In later meetings it was agreed that this program would cover all significant centres of population and that all locally significant pollutants should be monitored.

An important part of the program is the summarizing of the monitoring network data on a monthly basis. Further information may be obtained from the Technology Development Branch, Environmental Protection, or any of the cooperating agencies listed on page vii.

AVANT-PROPOS

Le programme de surveillance nationale de la pollution atmosphérique (SNPA) est un projet conjoint des gouvernements fédéral et provinciaux.

La connaissance de la nature et de l'importance de la pollution atmosphérique au Canada est essentielle à la bonne planification de programmes de lutte contre la pollution. C'est pourquoi le but général du programme est d'assurer le contrôle et l'évaluation continus de la qualité de l'air ambiant des régions urbaines du Canada. Le programme répond aussi à un certain nombre d'autres besoins et devient, sous ce rapport, de plus en plus utile à mesure que les données s'accumulent. Ainsi, il sera possible de déceler dans quel sens évolue la pollution, dans le temps, par rapport aux changements touchant les activités industrielles, à la densité démographique ainsi qu'aux progrès enregistrés au chapitre des mesures de lutte contre la pollution.

C'est pour ces raisons qu'à leurs réunions de 1969 et de 1970, les fonctionnaires fédéraux et provinciaux chargés de la lutte contre la pollution atmosphérique ont reconnu qu'il fallait donner la priorité à l'établissement d'un programme complet de surveillance de la pollution atmosphérique à l'échelle nationale. À l'occasion de réunions ultérieures, il a été décidé que le programme devrait toucher tous les principaux centres urbains et prévoir la surveillance de tous les polluants d'importance locale.

La publication mensuelle des résultats de la surveillance constitue une réalisation importante du programme. On peut se procurer de l'information additionnelle en s'adressant à la Direction du développement technologique, Protection de l'environnement, ou aux organismes collaborateurs énumérés à la page vii.

INTRODUCTION

The data reported in this summary were gathered by the cooperating agencies and compiled by Environment Canada. As of December 1990, data were being reported from 399 sampling instruments in 51 cities across the ten provinces and the two territories. Measurements are being taken for sulphur dioxide, carbon monoxide, nitrogen dioxide, ozone, soiling index, suspended particulates, lead, sulphate, nitrate, dustfall and sulphation rate.

In addition to coordinating the National Air Pollution Surveillance Program, the federal government, in a number of locations, provides the monitoring equipment for sampling stations operated by a cooperating provincial or municipal agency. In other locations, the equipment is provincially or municipally owned. The federal Environmental Protection Directorate also operates sampling stations in the National Capital Region, the Yukon and the Northwest Territories.

The NAPS Network has reached planned size, although development is a continuing process. Changes are reflected in the monthly summaries.

The reader will, no doubt, wish to compare pollution levels in different cities. Caution should be exercised in this regard. The data represent the condition of the air in the vicinity of the individual sampling stations but may not necessarily represent community-wide air quality. For assistance in interpreting data from individual stations, the reader should refer to the report "Site Documentation for NAPS Network Air Monitoring Stations".

This summary is divided into two parts. The first part presents the compilation of the data obtained during the year for the pollutants measured. The second part compares the data for the year with the National Air Quality Objectives.

INTRODUCTION

Les données contenues dans le présent extrait ont été réunies par les organismes collaborateurs et compilées par Environnement Canada. En décembre 1990, les données étaient obtenues de 399 appareils d'échantillonnage répartis dans 51 villes des dix provinces et des deux territoires. Les mesures portent sur le dioxyde de soufre, le monoxyde de carbone, le dioxyde d'azote, l'ozone, l'indice de souillure, les particules en suspension, le plomb, le sulfate, le nitrate, les retombées de poussières et l'indice de formation de sulfate.

En plus de coordonner le Programme de surveillance nationale de la pollution atmosphérique, le gouvernement fédéral fournit, à certains endroits, le matériel de contrôle nécessaire aux postes d'échantillonnage exploités par un organisme provincial ou municipal. Ailleurs, les provinces et les municipalités fournissent des données recueillies à partir de leur propre matériel. La Direction générale de la protection de l'environnement exploite aussi des stations dans la région de la Capitale nationale, le Yukon et les Territoires du Nord-Ouest.

Le réseau de surveillance a atteint l'étendue prévue bien qu'il soit en évolution continuelle. Les extraits mensuels font foi des changements réalisés.

Le lecteur sera sans doute tenté d'établir des comparaisons entre les niveaux de pollution de villes différentes. Sur ce point, il doit se montrer prudent. Les données ne représentent que la qualité de l'air à proximité des stations d'échantillonnage, et non pas nécessairement dans la ville entière. Le lecteur pourra se référer, au besoin, au rapport «Documentation sur l'emplacement des stations d'échantillonnage du réseau SNPA» pour interpréter les données provenant de stations individuelles.

Le présent extrait comprend deux parties. La première partie donne la compilation des données du réseau pour l'année selon les différents paramètres de pollution. La deuxième partie compare les données du réseau aux objectifs nationaux de la qualité de l'air.

Each sampling station is identified by a code defining its location. The first digit of the code indicates the province, the second and third digits, the city, and the fourth and fifth digits, the station location within the city. Land use in the vicinity of the station is classified as Commercial (C), Residential (R), or Industrial (I). In the List of Stations, the ownership of the equipment is indicated as federal (F), provincial (P), or municipal (M). The height of the sampling inlet is given in metres above ground level.

Chaque station d'échantillonnage porte un numéro de code qui sert à indiquer son emplacement. Le premier chiffre du numéro identifie la province, les deuxième et troisième, la ville, et les quatrième et cinquième, les différentes stations d'une même ville. Une lettre permet d'indiquer si la station est située dans une zone commerciale (C), résidentielle (R) ou industrielle (I). Dans la «Liste des stations», le propriétaire du matériel est désigné par une lettre : (F) s'il s'agit du gouvernement fédéral, (P) du gouvernement provincial et (M) d'une municipalité. La hauteur où se fait l'échantillonnage est indiquée en mètres par rapport au sol.

Monthly or annual means are not calculated unless at least 50% of the hourly observations are available for the period concerned. Furthermore, the annual mean is not calculated unless monthly means are reported for at least two months in each quarter. The 8-h and 24-h running means are not calculated unless 75% of the hourly observations are available.

PART II

II^e PARTIE

COMPARISON OF 1990 DATA WITH NATIONAL AIR QUALITY OBJECTIVES

COMPARAISONS DES DONNÉES DE 1990 AVEC LES OBJECTIFS NATIONAUX DE LA QUALITÉ DE L'AIR

DATA PRESENTED

This section compares National Air Pollution Surveillance (NAPS) Network data to the National Air Quality Objectives (Table 1). The comparison is made using six different tables. The table on page 71 provides a summary of the status of air quality measured in the NAPS Network in 1990 with respect to the National Air Quality Objectives. A code indicates for every pollutant monitored at each station whether any air quality objective was exceeded during the year and, if so, the specific objective that was exceeded.

The next five tables (pages 74-83) provide a more detailed analysis of the data for each of five pollutants: Sulphur Dioxide, Carbon Monoxide, Nitrogen Dioxide, Ozone and Suspended Particulates. The tabulations indicate the number of times during the year that the maximum desirable, acceptable and tolerable levels were exceeded. As well, the annual mean is categorized with respect to the appropriate air quality objective range.

The number of readings or measurements available during the year is also given in the tables. It should be noted that if a maximum level was not exceeded during the year it is indicated by "0", while if an objective has not been defined for the range shown, no numbers are reported. Data completeness criteria must also be satisfied if valid annual means are to be calculated and reported; the notation "INVALID" indicates that a valid annual mean cannot be computed.

NOTE TO READERS

Readers should exercise caution when making judgements with respect to overall air quality for a given area. The air quality for a city generally cannot be defined on the basis of the air quality measured at a single monitoring site. If there is more than one sampling site in a city, data from all of the sites should be examined. Air quality measured at a specific site represents the condition of the air in the vicinity of that site and may not necessarily

DONNÉES PRÉSENTÉES

La présente partie compare les données du réseau de surveillance nationale de la pollution atmosphérique (SNPA) aux objectifs nationaux de la qualité de l'air (tableau 1). La comparaison est faite dans six tableaux différents. Le tableau de la page 71 donne un résumé de la situation de la qualité de l'air mesurée en 1990 par le réseau SNPA, par rapport aux objectifs nationaux. Pour chaque polluant contrôlé à chaque point, un code indique si un objectif a été dépassé pendant l'année et, si oui, lequel.

Les cinq autres tableaux (pages 74 à 83) fournissent une analyse plus détaillée des données relatives à chacun de cinq polluants : dioxyde de soufre, monoxyde de carbone, dioxyde d'azote, ozone et particules en suspension. Les tableaux indiquent le nombre de fois pendant l'année que les concentrations souhaitables, acceptables et tolérables ont été dépassées. De plus, on indique dans quelle catégorie de concentrations se situe la moyenne annuelle.

On y trouve aussi le nombre de relevés ou de mesures disponibles pour l'année. Il faut remarquer que, si un certain niveau maximal n'a pas été dépassé pendant l'année, on l'indique par un «0» et que, si un objectif n'a pas été défini pour la catégorie indiquée, aucun chiffre n'est inscrit. Il faut de plus répondre à certains critères d'intégralité si l'on veut calculer et présenter des moyennes annuelles valables; la mention «INVALIDE» signifie qu'il est impossible de calculer une moyenne annuelle valable.

AVIS AUX LECTEURS

Il faut agir avec prudence lorsque l'on porte des jugements sur la qualité générale de l'air d'une région donnée. Normalement, on ne peut juger de la qualité de l'air de toute une ville à partir d'un échantillon prélevé en un seul point; s'il y a plus d'un point de prélèvement dans la ville, il faut tenir compte des échantillons de chacun de ces lieux pour établir une moyenne. La qualité de l'air mesurée en un endroit précis représente l'état

represent community-wide air quality. For assistance in interpreting data from individual sites, the reader should refer to the report "Site Documentation for NAPS Network Air Monitoring Stations".

Also, readers should be aware that air quality standards, criteria or objectives have been promulgated by provincial or municipal authorities for most provinces. Although these provincial standards are for the most part similar to the National Air Quality Objectives, they may not necessarily coincide with them. Most provincial standards are single-level and for some provinces may be comparable to the national desirable levels, whereas for other provinces local standards may be related more to the acceptable or even tolerable national objectives. In general these differences are a reflection of the fact that air pollution abatement strategies vary from province to province. Local or provincial authorities should be consulted for further information on current standards or for provincial reports on community air quality where available.

de l'air dans le voisinage immédiat de ce lieu et n'est pas nécessairement représentative de l'ensemble de la ville. Le lecteur devrait se référer au rapport «Documentation sur l'emplacement des stations d'échantillonnage du réseau SNPA» pour l'interprétation de données provenant des emplacements individuels.

Le lecteur doit aussi savoir que des normes, critères et objectifs de la qualité de l'air ont été établis par les autorités provinciales et municipales dans la plupart des provinces. Bien que ces normes provinciales soient le plus souvent semblables à celles qu'a fixées le gouvemement fédéral, elles ne coïncident pas nécessairement avec ces dernières. La majorité des normes provinciales énoncent des concentrations uniques et peuvent se comparer, dans certaines provinces, aux concentrations souhaitables à l'échelle nationale; par contre, dans d'autres provinces, les normes peuvent se rapprocher davantage des objectifs nationaux acceptables ou tolérables. Cette situation s'explique en général par le fait que les stratégies de lutte contre la pollution de l'air varient d'une province à l'autre. Pour obtenir des renseignements supplémentaires sur les normes en vigueur ou des rapports provinciaux sur la qualité de l'air dans les villes, s'adresser aux autorités locales ou provinciales.

* Conditions of 25°C and 101.325 kPa are used as the basis for conversion from $\mu g/m^3$ to ppm and ppb.
** Proposed.

Note: The maximum desirable level defines the long-term goal for air quality and provides a basis for an anti-degradation policy for the unpolluted parts of the country and for the continuing development of control technology.
The maximum acceptable level is intended to provide adequate protection against adverse effects on soil, water, vegetation, materials, animals, visibility, personal comfort and well-being.
The maximum tolerable level denotes a concentration of an air contaminant that requires abatement without delay to avoid further deterioration to an air quality that endangers the prevailing Canadian lifestyle or, ultimately, to an air quality that poses a substantial risk to public health.

** Proposé.

À noter : Le niveau maximal souhaitable est un objectif à long terme de qualité de l'air en fonction duquel on définit une politique visant la protection des parties du pays non touchées par la pollution et le développement continu de techniques antipollution.

Le niveau maximal acceptable vise à protéger le sol, l'eau, la végétation, les matériaux, les animaux, la qualité de la vie et le bien-être de la population contre les effets néfastes de la pollution et à éviter une réduction de la visibilité.

Le niveau maximal tolérable est la concentration d'un polluant à partir de laquelle il faut prendre des mesures immédiates afin d'éviter que la qualité de l'air se détériore au point de menacer le mode de vie des citoyens ou, en dernière analyse, de présenter un risque important pour la santé publique.
